

Data-Flow Analysis for PLC Programs

Presented by : Sreeja S. Nair

Guided By : Dr. Raoul Jetley, Dr. Anil R. Nair, Dr. S. Ashok

July 2, 2015

Problem Definition

Specified run-time errors need to be detected during development time with the help of static analysis techniques

Introduction

IEC 61131-3 - Standard for the five PLC programming languages

- Structured Text (ST)
- Sequential Function Chart (SFC)
- Function Block Diagram (FBD)
- Instruction List (IL)
- Ladder Diagram (LD)

Introduction(Contd..)

Probable run-time errors

- Division by zero
- Array access out of bounds
- Use of uninitialized variables
- Unused Variables
- Invariant if condition
- Unreachable code
- Infinite loops

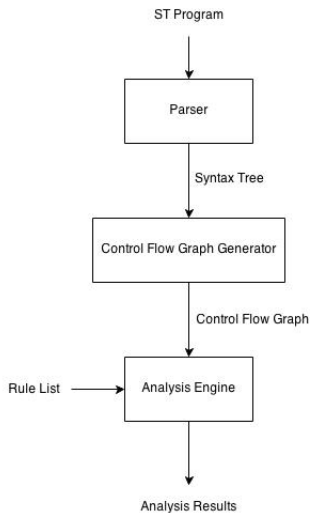

Data-Flow Analysis

- A technique for gathering information about the possible set of values calculated at various points in a computer program.
- A sample data-flow analysis :

P1 : $x := 1$;
P2 : while ($x < 100$) do
P3 : $x := x + 1$;
P4 : end_while;

Program point	Range of x
P1	[1,1]
P2	[1,99]
P3	[2,100]
P4	[100,100]

Tool Structure

Mile stones

- Interview control system engineers to list critical run-time errors
- Finalize errors according to priority
- Implement grammar
- Generate Parse Tree
- Generate Abstract Syntax Tree
- Generate Control Flow Graph
- Design and implement analysis framework
- Design and implement algorithms for error rules
- Implement error handler

Control Builder Integration

- Control Builder
 - ABB's product for building Control System projects
 - Supports all five languages specified by IEC 61131-3 standard
- CBOpenInterface
 - Interface provided by ABB, for project details extraction

Screenshot

Screenshot (Contd..)

The screenshot displays a software interface with three main components:

- Variable Declaration Table:**

Variable	Data Type	Type	Type path	Initial Value	Direction
Age	int	Program Variable	System.int	40	
Climb_Height	int	Program Variable	System.int	100	
Mountain_Height	int	Program Variable	System.int	4000	
ResetCounter	bool	Program Variable	System.bool	false	
Oxygen	bool	Program Variable	System.bool	true	
Wind	bool	Program Variable	System.bool	true	
Previous_Climb	bool	Program Variable	System.bool	true	

Below the table, there are tabs for "Program Variable" and "Communication Variable". The "Program Variable" tab is active, showing a list of variables and their types.

Code Editor:

```
1: Can_Climb(In => Age,
2:   Get => Challenge,
3:   Reset => ResetCounter,
4:   Out => Temperature,
5:   Places => Climb_Height);
6:
7:
8: (*Mountain_Height = Can_Climb Places;*)
9:
10: Mountain_Height := 20;
11: Temperature := 30;
12:
13: Weight := add(Mountain_Height, Temperature);
14:
15: Safety_Breared(CI => Previous_Climb,
16:   Load => Oxygen,
17:   PV => Weight,
18:   Q => Wind,
19:   CV => Climb_Height);
20:
21:
22: Ft_Air(CI => Challenge,
23:   Reset => ResetCounter,
24:   PV => Age,
25:   Q => Oxygen,
26:   CV => Temperature);
27:
28: call in1 => Age,
29:   in2 => Age,
30:   out => Mountain_Height);
```

Project Explorer:

- array_out_of_bounds.pt
- Applications
 - Application_1
 - ControlModuleTime
 - Programs
 - Program1
 - Program2
 - Program3
 - Diagrams

Screenshot (Contd..)

The screenshot displays the 'Parser' application window. At the top, the title bar reads 'Parser'. Below it, a 'Project' tab is active, showing a table of variables. The table has columns: Variable, Data Type, Type, Type path, Initial Value, and Direction. The variables listed are: 'i' (int, Program Variable, System.int, 40), 'Climber_Height' (int, Program Variable, System.int, 100), 'Mountain_Height' (int, Program Variable, System.int, 4000), 'ResetCounter' (bool, Program Variable, System.bool, false), 'Oxygen' (bool, Program Variable, System.bool, true), 'Wind' (bool, Program Variable, System.bool, true), 'Resource_Clockwise' (bool, Program Variable, System.bool, true), and 'Resource_Clockwise' (bool, Program Variable, System.bool, true). Below the table, there are tabs for 'Program Variable' and 'Communication Variable'. The 'Program Variable' tab is selected, showing a code editor with the following code:

```
Code | Abstract Syntax Tree | Control Flow Graph | Control Flow Graph Elements | Function Blocks |  
Cen_Demo | It_Air | Walkable | Safety_Insured | Calone_Count | call |  
[Code] | Variables | Abstract Syntax Tree | Control Flow Graph | CFG Elements |  
Code  
1: out <= in1/In2 * 10 - in1;
```

 On the right side of the window, the 'Project Explorer' pane shows a tree structure: 'array_out_of_bounds.pt' -> 'Applications' -> 'Application_1' -> 'ControlModuleTime' -> 'Programs' -> 'Program1' -> 'Program2' -> 'Program3' -> 'Diagrams'.

Variable	Data Type	Type	Type path	Initial Value	Direction
i	int	Program Variable	System.int	40	
Climber_Height	int	Program Variable	System.int	100	
Mountain_Height	int	Program Variable	System.int	4000	
ResetCounter	bool	Program Variable	System.bool	false	
Oxygen	bool	Program Variable	System.bool	true	
Wind	bool	Program Variable	System.bool	true	
Resource_Clockwise	bool	Program Variable	System.bool	true	
Resource_Clockwise	bool	Program Variable	System.bool	true	

Project Explorer

 - Diagrams

Grammar

- Describes the hierarchical structure of a program
- Terminals - elementary symbols
- Non-terminals - variable symbols
- Productions - rules
- Start symbol - one non-terminal
- Example

```
expr.Rule = term | unExpr | binExpr | relExpr;  
term.Rule = N | parExpr | funCall | identifier;  
parExpr.Rule = LEFT_PAREN + expr + RIGHT_PAREN;  
unExpr.Rule = unOp + term + ReduceHere();  
unOp.Rule = ToTerm("-") | "+" | NOT;  
binExpr.Rule = expr + binOp + expr;  
binOp.Rule = ToTerm("+") | "-" | "*" | "/" | "**" | "mod";  
relExpr.Rule = expr + relOp + expr;  
relOp.Rule = AND | OR | XOR | "=" | "<" | "<=" | ">" | ">=" | "<>" | "&;
```

- Lexical Analyzer (Scanner)
- Tokens
- Syntactic Analyzer (Parser)
- Parse Tree
- Abstract Syntax Tree
- INPUT : ST program
- OUTPUT : AST

Screenshot

The screenshot displays the Parser application interface, which includes a variable table, a project explorer, and an abstract syntax tree (AST) view.

Variable Table:

Variable	Data Type	Type	Type path	Initial Value	Direction
Age	dint	Program Variable	System dint	40	
Chamber_Height	dint	Program Variable	System dint	100	
Mountain_Height	dint	Program Variable	System dint	4000	
ResetCounter	bool	Program Variable	System bool	false	
Oxygen	bool	Program Variable	System bool	true	
Wind	bool	Program Variable	System bool	true	
Reactive_Challenge	bool	Program Variable	System bool	true	

Project Explorer:

 - Applications
 - Application_1
 - ControlModuleTime
 - Programs
 - Program1
 - Program2
 - Program3
 - Diagrams

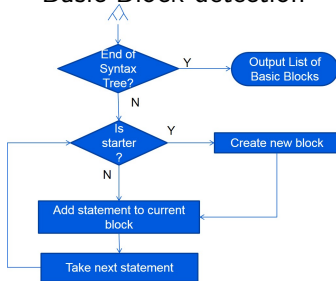

Abstract Syntax Tree (AST):

```
graph TD
    CallCanClimb[Call Can_Climb] --> TargetCanClimb[Target Can_Climb]
    TargetCanClimb --> Arg1[Arg]
    Arg1 --> Assignment1[assignment]
    Assignment1 --> In[In]
    In --> Age[Age]
    Arg1 --> Arg2[Arg]
    Arg2 --> Assignment2[assignment]
    Assignment2 --> Set[Set]
    Set --> Challenge[Challenge]
    Arg2 --> Arg3[Arg]
    Arg3 --> Assignment3[assignment]
    Assignment3 --> Read[Read]
    Read --> ResetCounter[ResetCounter]
    Arg3 --> ReturnValue1[return Value]
    ReturnValue1 --> Out[Out]
    Out --> Temperature[Temperature]
    Arg3 --> ReturnValue2[return Value]
    ReturnValue2 --> Places[Places]
    Places --> Chamber_Height[Chamber_Height]
    Arg3 --> Assignment4[assignment]
    Assignment4 --> Mountain_Height[Mountain_Height]
    Mountain_Height --> 20[20]
    Arg3 --> Assignment5[assignment]
    Assignment5 --> Temperature2[Temperature]
    Temperature2 --> 30[30]
    Arg3 --> Assignment6[assignment]
    Assignment6 --> Weight[Weight]
    Weight --> CallAdd[Call add]
    CallAdd --> Tensec[Tensec: add]
```

Control Flow Graph Generator

- Control Flow Graph
- INPUT : AST
- OUTPUT : CFG

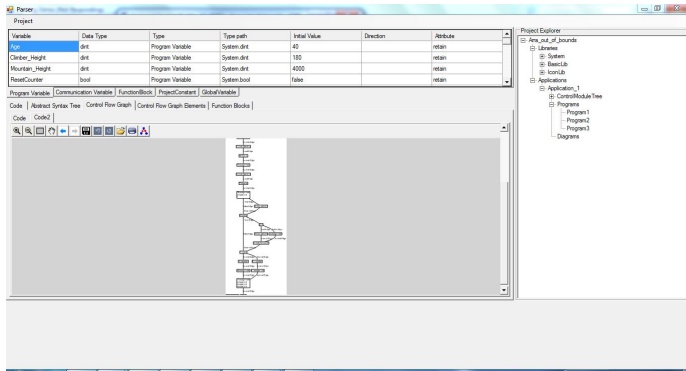

Basic Block detection

Connecting Basic Blocks

Screenshot

Data-Flow framework

- Data-Flow Analysis
- Data-Flow Framework - (D, V, \cap, F)
 - D - Direction
 - (V, \cap) - Semilattice
 - V - Domain
 - \cap - Meet Operator
 - F - Transfer Function

Data-Flow Algorithms for Rules

Error Rules

- Division by zero
- Array access out of bounds
- Use of uninitialized variables
- Unused variables
- Invariant if condition
- Unreachable code
- Infinite loops

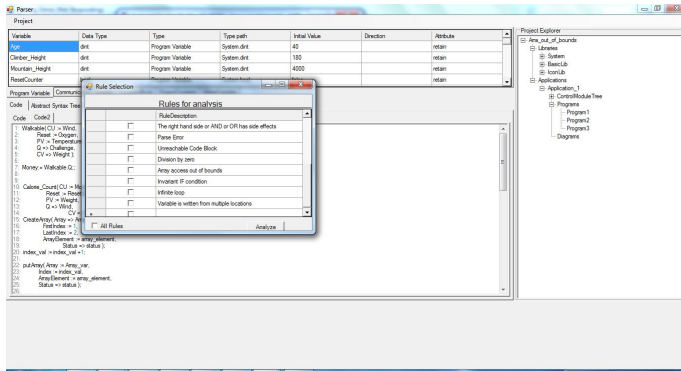

Analysis Algorithms

- Reaching Definitions
- Live Variable Analysis
- Interval Analysis

Error Handler

- Violation of rules
- Display message
 - Error name
 - Error description
 - Source of error

Screenshot
